

**Supplemental Digital Figure 1** Percentage of medical student respondents willing to seek professional help for a serious emotional/mental health problem in comparison to that of the general U.S. population (ages 18-99 years old) and of aged-matched individuals (ages 22-35 years old). Figure suggests that medical student respondents are less willing to seek professional help for a serious emotional/mental health problem than are members of the general U.S. population or age-matched peers. Population level data obtained from the Collaborative Psychiatric Epidemiology Surveys, 2001-2003: National Comorbidity Survey-Replication, item CC51.
