

Supplemental Digital Content 2 Figure.

For all categorical variables, absolute standardized differences before and after propensity score matching are shown. *For continuous variables (age, duration of surgery) and ordinal variables (ASA physical status, Gagne score), the absolute differences as a percentage of the mean of the whole cohort are displayed. Solid vertical line represents 10% for absolute standardized difference. No parameters fall outside this line after propensity score matching. ARB=angiotensin receptor blocker, ASA=American Society of Anesthesiologists, POD=postoperative day
