“Responders” refers to patient who reaches a spontaneous respiratory rate equal or less than 10 bpm with a esophageal pressure swing equal or lower than 8 cmH₂O at the high gas low, (“relief”). “Non responders” is considered a patient who doesn't reach the threshold values of the “relief” at the

highest gas flow. Data are shown for descriptive purpose. Due to the very small size of the two groups, no statistical analysis was performed. * One missing value.
