

Supplemental Figure S3

Hematological change in mild or severe sepsis with or without systemic IFN β . Complete blood counts of peripheral blood from 4 cohorts of mice. Blood was drawn 24 hours after cecal ligation and puncture. **A.** white blood cell, **B.** hemoglobin, and **C.** platelets. Hatched bar, mild sepsis control (mCLPctrl); open bar, severe sepsis control (sCLPctrl); closed bar, severe sepsis with therapeutic IFN β (sCLP-tIFN β); and gray bar, severe peritonitis with prophylactic IFN β (sCLP-pIFN β).
