

A. Spike frequency AUC/respiratory cycle

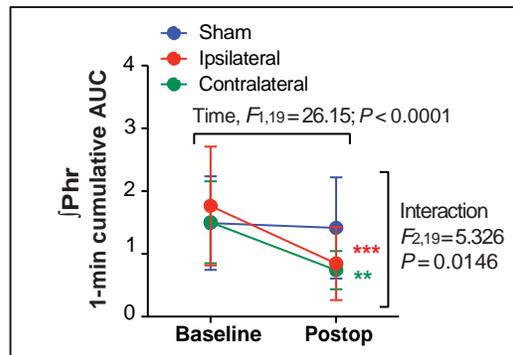

B. Spike frequency AUC/minute

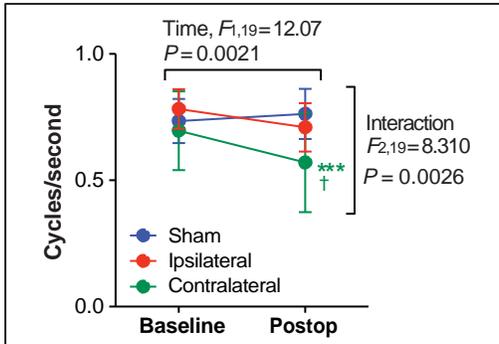

C. jPhr AUC/respiratory cycle

D. jPhr AUC/minute

E. Central respiratory rate

F. TI:TE

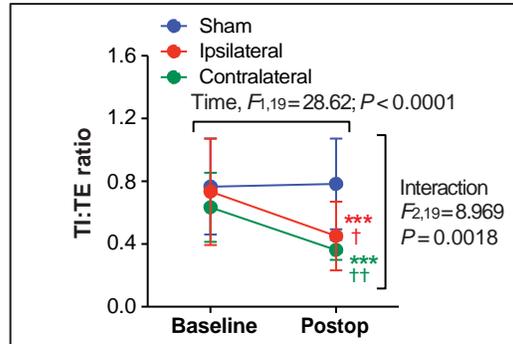

Figure S1. Raw (non-normalized) data for the Protocol A, the short-term effect of upper abdominal incision vs. sham incision on efferent phrenic nerve activity. (A) One hour after the upper abdominal incision (Postop), spike frequency area-under-the-curve (AUC)/respiratory cycle was significantly lower compared with baseline in the Ipsilateral ($P = 0.0001$) and the Contralateral groups ($P = 0.0006$), but not in the Sham group ($P = 0.8767$). (B) The spike frequency AUC/minute after the incision was significantly lower than baseline only in the Ipsilateral ($P = 0.0005$) and the Contralateral groups ($P < 0.0001$), but not in the Sham group ($P > 0.9999$). While there was no difference among the groups at baseline, the mean value of the Contralateral group was significantly lower than that of the Sham group ($P = 0.0153$) 1 hour after the incision. (C) The integrated phrenic neurogram (jPhr) AUC/respiratory cycle after the incision was significantly lower compared with baseline in the Ipsilateral group ($P = 0.0053$). (D) There was a significant decrease in the Phr AUC/minute from baseline after the incision in the Ipsilateral ($P = 0.0007$) and the Contralateral ($P = 0.0038$) groups, but not in the Sham group ($P = 0.9716$). (E) There was a significant decrease in central respiratory rate from baseline after the incision in the Contralateral group ($P = 0.0008$). The central respiratory rate of the Contralateral group was significantly lower than the Sham group ($P = 0.0149$) after the incision. (F) There was a significant decrease in inspiratory-to-expiratory duration ratio (TI:TE) from baseline after the incision in the Ipsilateral ($P = 0.0004$) and the Contralateral groups ($P = 0.0006$), but not in the Sham group ($P = 0.9867$). One hour after the incision, TI:TE of the Ipsilateral and the Contralateral groups were significantly lower than that of the Sham group ($P = 0.0446$ and $P = 0.0087$, respectively). Data are presented as mean \pm SD. The sample size per group was: $N = 7$ in the Ipsilateral and Contralateral groups; $N = 8$ in the Sham group. ** $P < 0.01$; *** $P < 0.001$; **** $P < 0.0001$ vs. Baseline,

and †P < 0.05; ††P < 0.01 vs. Sham by two-way ANOVA with repeated measured in one factor, followed by Sidak's multiple comparison tests.
