

Supplementary Figure 3. Effects of dorsal root ganglion stimulation with different intensity on Conditioned Place Preference test in rats with tibial nerve injury, showing preference at baseline (Pre-test) and after treatment (A, B), and the treatment effect normalized to the pre-test baseline (C). For comparison, the data in (B) are the same data in Figure 6 on effects of L4 dorsal root ganglion stimulation in rats with tibial nerve injury. Results are means \pm SD. * $P < 0.05$, ** $P < 0.01$ by the paired t-test (B) and the t-test (C). n, number of animals.
