

Supplemental Figure 4: Home opioid use after hospital discharge. (A) Number of opioid pills used. Results are the median and 25th and 75% quartiles of individual patient values in each group. (B) Fraction of pills unused compared to the number prescribed. Results are the median and 25th and 75% quartiles of individual patient values in each group. (C) Fraction of sum total pills used and unused in each group compared to the total number prescribed. Exploratory statistical analysis found the fraction of opioids used was less in patients receiving methadone vs controls ($P < 0.01$ in all methadone groups).
