Figure. Change from baseline in geographic atrophy (GA) lesion area in the study eye in the modified intent-to-treat population. Data shown are least-square means ± standard error from a mixed-effects repeated-measures model using observed values (with no imputation for missing values) and fixed effects of treatment, visit, the treatment-by-visit interaction, the baseline area-by-visit interaction, and baseline GA lesion area as a covariate. Arrows indicate timing of study treatments. \( P=0.077 \) for Brimo DDS 132 µg vs sham at month 3.
