SDC 3 (figure): Comparisons of waning of measles vaccine virus-specific antibody by asthma status in three categories (non-asthmatics, asthmatics prior to enrollment, and asthmatics after enrollment). The trend lines are based on fitting a cubic spline to the data. Asthmatics before or after enrollment had trends of a more rapid waning of measles antibody than non-asthmatics but there was no difference in waning of measles antibody between asthmatics before enrollment and asthmatics after enrollment.
