

Closed Triradiate Cartilage at Brace Prescription

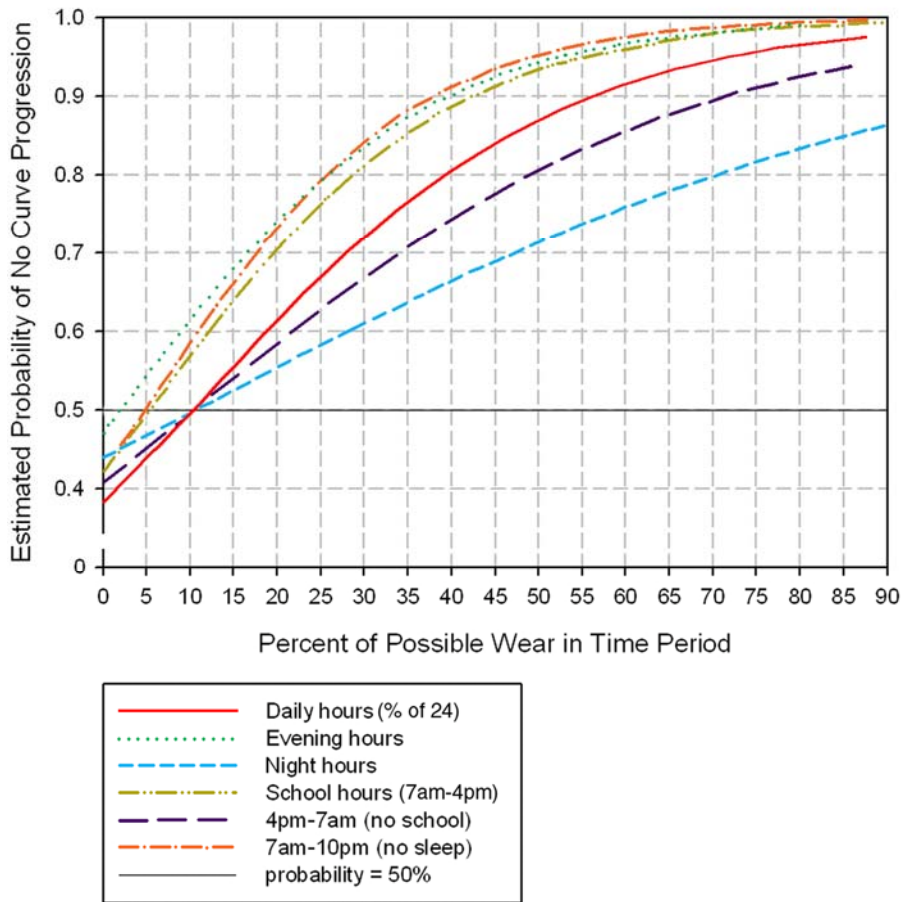

Fig. E-1
 Line graph illustrating the hours of brace wear during certain daily periods relative to curve nonprogression in the closed triradiate cartilage group.

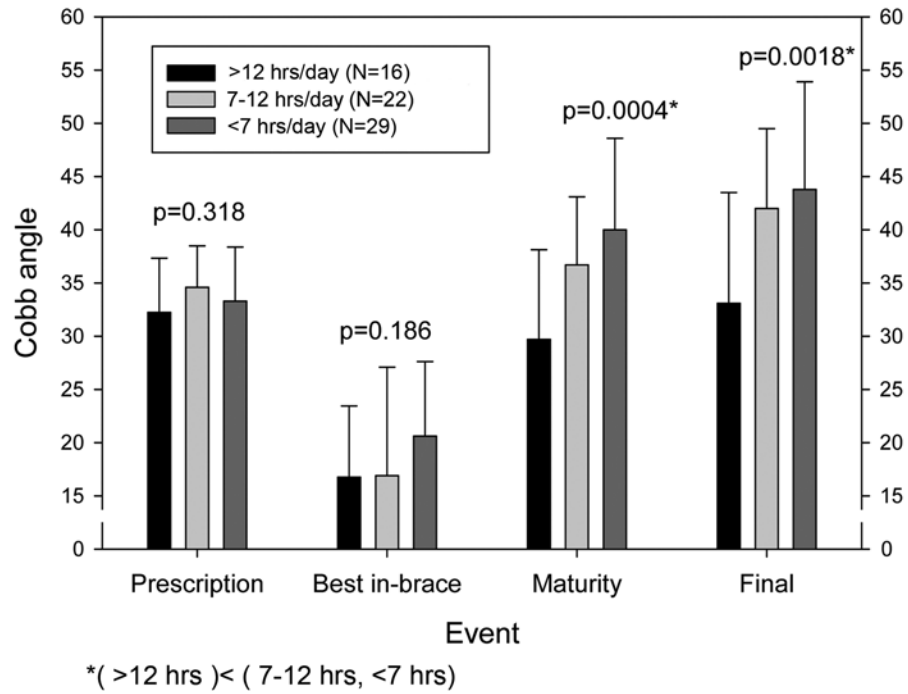

Fig. E-2

Graph comparing measures of scoliosis curves at various intervals in patients who wore the brace for more than twelve hours per day, seven to twelve hours per day, or fewer than seven hours per day. Patients with more than twelve hours of wear per day had significantly less progression than the others.
