

HR & MAP at Pinning

Supplemental Figure 5: Boxplot with individual values of the heart rate (HR) and mean arterial pressure (MAP) by group prior to and after pinning. The clinically relevant threshold was set at a value of 110 beats per minute for HR and 130 mm Hg for MAP.

Rectangles reflect the Q1, median and Q3 of the data, the diamond reflects the mean, while data points beyond the whiskers reflect outliers.
