- Figure S22. Comparison of predicted median ACR based on models with PCR transformed with a restricted cubic spline (C1), and with PCR transformed with a linear spline (L1).
- Figure S23. Scatterplot of measured ACR and median ACR predicted from the linear spline model (L2).
- Figure S24. Scatterplot of measured ACR versus ACR estimated from PCR measurements using the equations of Tangri et al. (2016).
- Figure S25. Scatterplot showing measured ACR versus ACR estimated from PCR measurements using the equation of Collier et al. (2009).
- Figure S26. Estimated median, 25th and 75th percentiles of ACR at the KDIGO A1/A2 and A2/A3 PCR thresholds of 150 and 500 mg/g, overall and by specified covariate.

Table S1. Equations to estimate the median, 25th and 75th percentiles of ACR from a PCR measurement, by sex, based on quantile regression models for log(ACR) containing the linear spline terms for log(PCR), sex, and interactions between sex and the spline terms.

Range of PCR (mg/g)	Equation to estimate median of log(ACR)	Equation to estimate 25 th percentile of log(ACR)	Equation to estimate 75 th percentile of log(ACR)
Females:			
<40	$1.7060 - 0.0572 * \log(\text{PCR})$	$1.2796 - 0.0386 * \log(\text{PCR})$	$1.6731 + 0.0642 * \log(\text{PCR})$
40 to <60	$0.2183 + 0.3460 * \log(\text{PCR})$	$0.7094 + 0.1159 * \log(\text{PCR})$	$-1.4845 + 0.9202 * \log(\text{PCR})$
60 to <250	$-6.2539 + 1.9269 * \log(\text{PCR})$	$-5.0158 + 1.5144 * \log(\text{PCR})$	$-5.3268 + 1.8587 * \log(\text{PCR})$
250 to <1000	$-4.4287 + 1.5963 * \log(\text{PCR})$	$-9.0693 + 2.2486 * \log(\text{PCR})$	$-1.9764 + 1.2519 * \log(\text{PCR})$
≥ 1000	$0.0445 + 0.9488 * \log(\text{PCR})$	$-0.0479 + 0.9426 * \log(\text{PCR})$	$-0.1429 + 0.9864 * \log(\text{PCR})$
Males:			
<40	$0.7373 + 0.1697 * \log(\text{PCR})$	$0.5589 + 0.1083 * \log(\text{PCR})$	$1.2593 + 0.1460 * \log(\text{PCR})$
40 to <60	$-2.7625 + 1.1184 * \log(\text{PCR})$	$-0.7944 + 0.4751 * \log(\text{PCR})$	$-5.9091 + 2.0891 * \log(\text{PCR})$
60 to <250	$-6.9212 + 2.1342 * \log(\text{PCR})$	$-7.6388 + 2.1469 * \log(\text{PCR})$	$-4.4236 + 1.7263 * \log(\text{PCR})$
250 to <1000	$-1.9690 + 1.2372 * \log(\text{PCR})$	$-4.8345 + 1.6390 * \log(\text{PCR})$	$-1.1395 + 1.1315 * \log(\text{PCR})$
≥ 1000	$-0.1522 + 0.9742 * \log(\text{PCR})$	$0.0862 + 0.9267 * \log(\text{PCR})$	$-0.2425 + 1.0016 * \log(\text{PCR})$

Log refers to the natural logarithm, so $\text{ACR} = \exp(\log(\text{ACR})) = 2.71828^{\log(\text{ACR})}$. Median predicted ACR = $\exp(\text{median of predicted } \log(\text{ACR}))$. ACR and PCR are in mg/g.

^aThe knots for the linear spline were at log(PCR) = 3.689, 4.094, 5.521 and 6.908, corresponding to PCR values of 40, 60, 250, 1000 mg/g. S1 to S5 represent the variables for the 5 linear spline segments.

^bThe reference age category was 18 to 59, the reference eGFR category was G1 to G3, and the reference lab location was Edmonton.

Table S3. Estimated median and interquartile range for ACR, at the KDIGO PCR category thresholds of 150 and 500 mg/g, for the overall cohort and for groups specified by covariates, and estimated PCR giving predicted median ACR at KDIGO ACR category thresholds.

Covariate	PCR = 150 mg/g		PCR = 500 mg/g		PCR (mg/g) giving predicted median ACR of 30 mg/g	PCR (mg/g) giving predicted median ACR of 300 mg/g
	Estimated median ACR	Estimated IQR for ACR	Estimated median ACR	Estimated IQR for ACR

The overall estimates are from quantile regression models containing only the cubic spline terms, while estimates for the effect of each covariate are from quantile regression models containing the cubic spline terms, the covariate(s), and interactions between the covariate(s) and the spline terms. Estimates of the median ACR are transformed from quantile regression models for the 50th percentile of log(ACR); estimates of the IQR of ACR are transformed from quantile regression models for the 25th and 75th percentiles of log(ACR). Estimates of PCR that give predicted median ACR at the KDIGO ACR category thresholds are from the 50th percentile models. IQR = interquartile range.

Figure S1. Median, 25th and 75th percentiles of predicted albumin:protein percent, by value of PCR, from quantile regression cubic spline models for log(ACR) including only the spline terms for log(PCR)

Figure S2. Median, 25th and 75th percentiles of predicted ACR by PCR value, log scale, from quantile regression cubic spline models of log(ACR) containing only the spline terms of log(PCR)

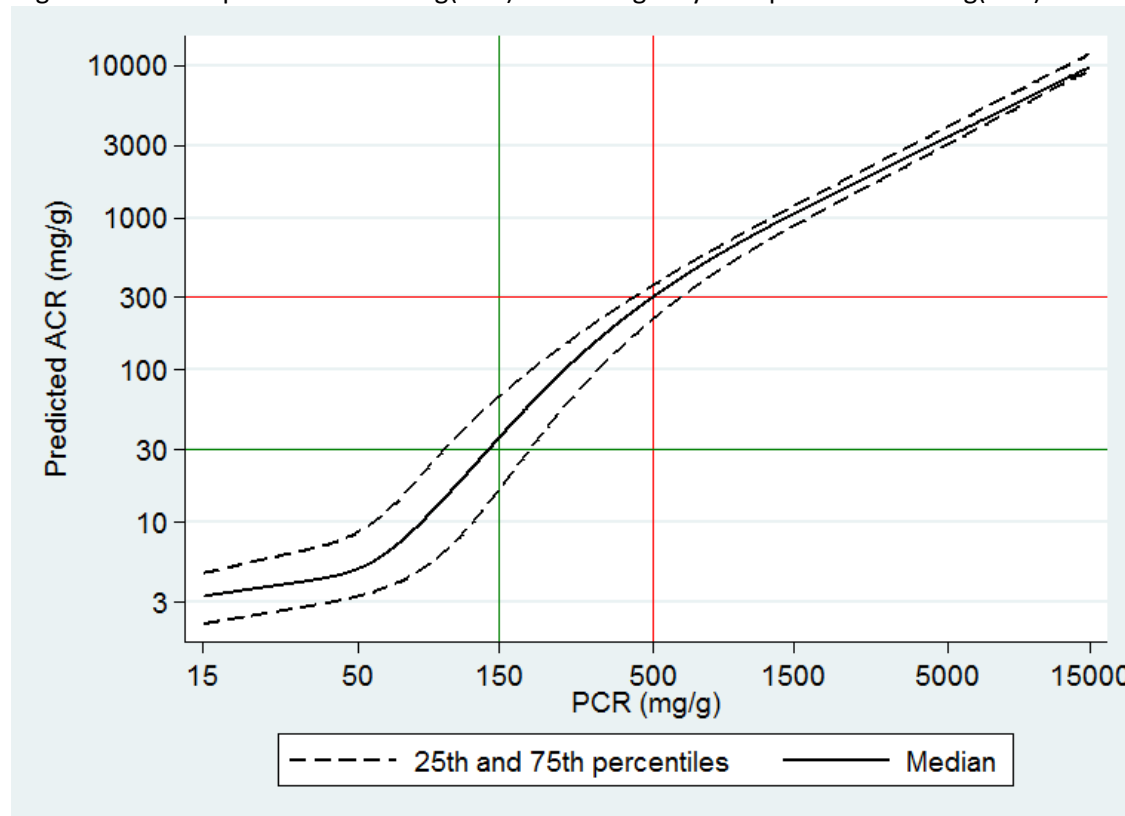

Figure S3. Effect of sex on predicted median ACR, log scale (from a model containing the cubic spline, sex, and spline interactions).

Figure S4. Predicted median, 25th and 75th percentiles of ACR for males and females, log scale (from quantile regression models containing the cubic spline, sex and spline interactions).

Figure S5. Effect of sex on predicted median ACR, linear scale, PCR < 600 mg/g (from a model containing the cubic spline, sex, and spline interactions).

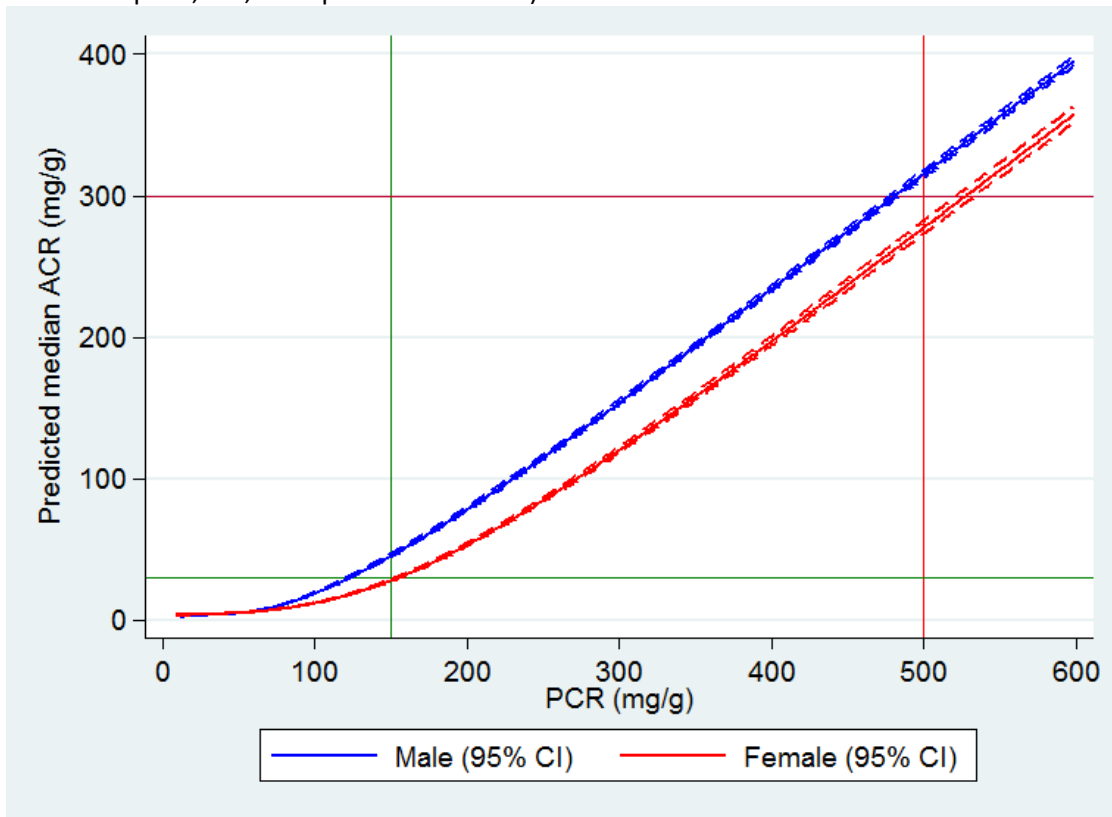

Figure S6. Effect of sex on predicted median albumin:protein percent (from a model containing the cubic spline, sex, and spline interactions).

Figure S7. Effect of age on predicted median ACR, log scale (from a model containing the cubic spline, age, and spline interactions).

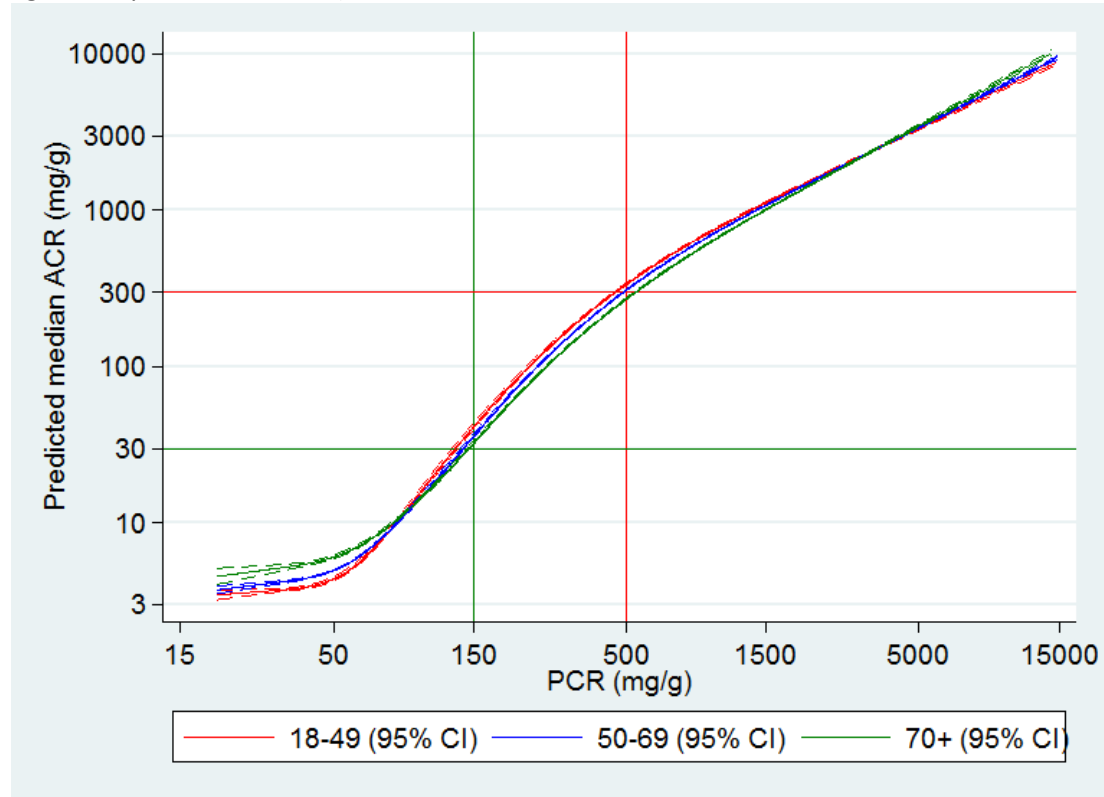

Figure S8. Effect of age on predicted median ACR, linear scale (from a model containing the cubic spline, age, and spline interactions).

Figure S9. Effect of age on predicted median albumin:protein percent (from a model containing the cubic spline, age, and spline interactions).

Figure S10. Effect of eGFR category on predicted median ACR, log scale (from a model containing the cubic spline, eGFR category, and spline interactions).

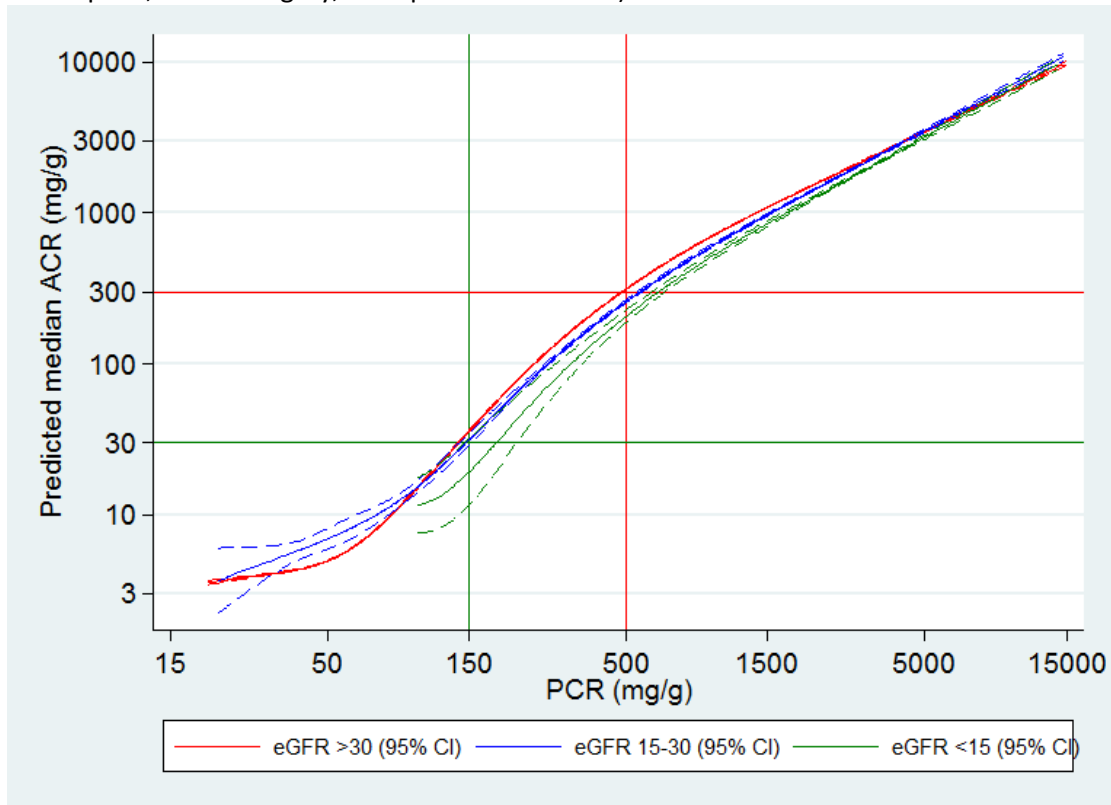

Figure S11. Effect of eGFR category on predicted median ACR, linear scale (from a model containing the cubic spline, eGFR category, and spline interactions).

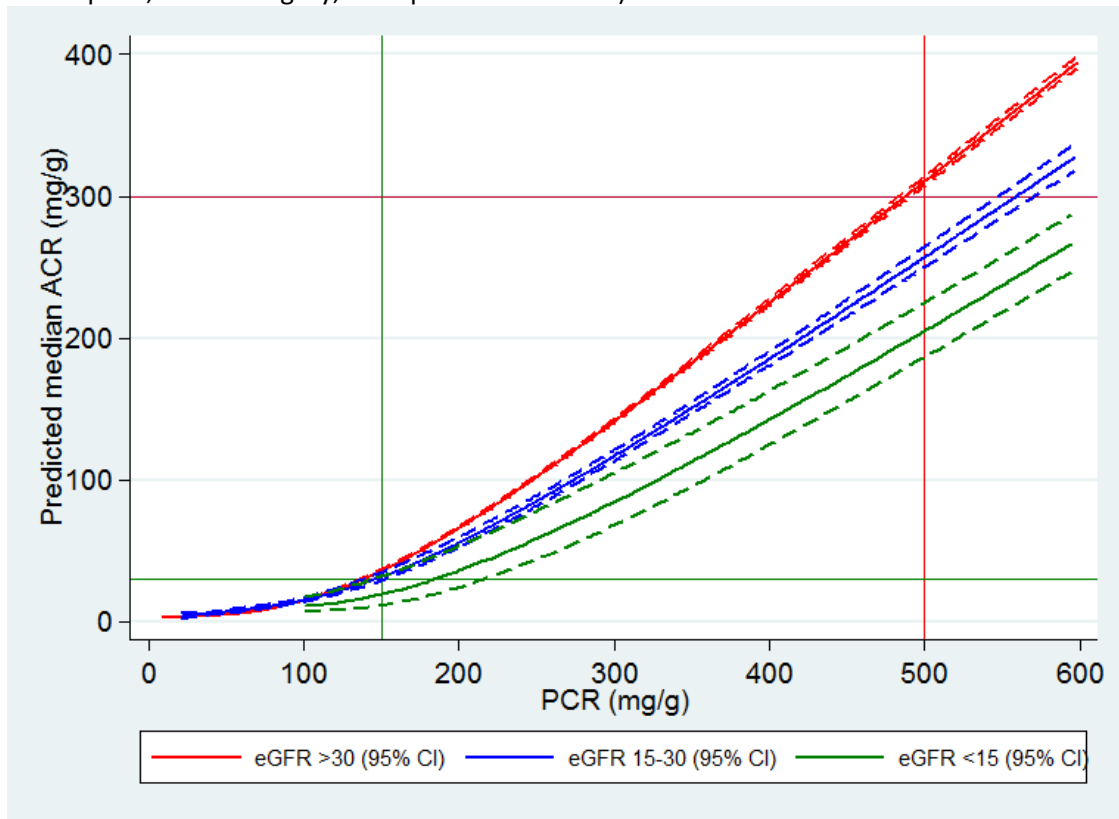

Figure S12. Effect of eGFR category on predicted median albumin to protein percent (from a model containing the cubic spline, eGFR category, and spline interactions).

Figure S13. Effect of diabetes on median ACR, log scale (from a model containing the cubic spline, diabetes, and spline interactions).

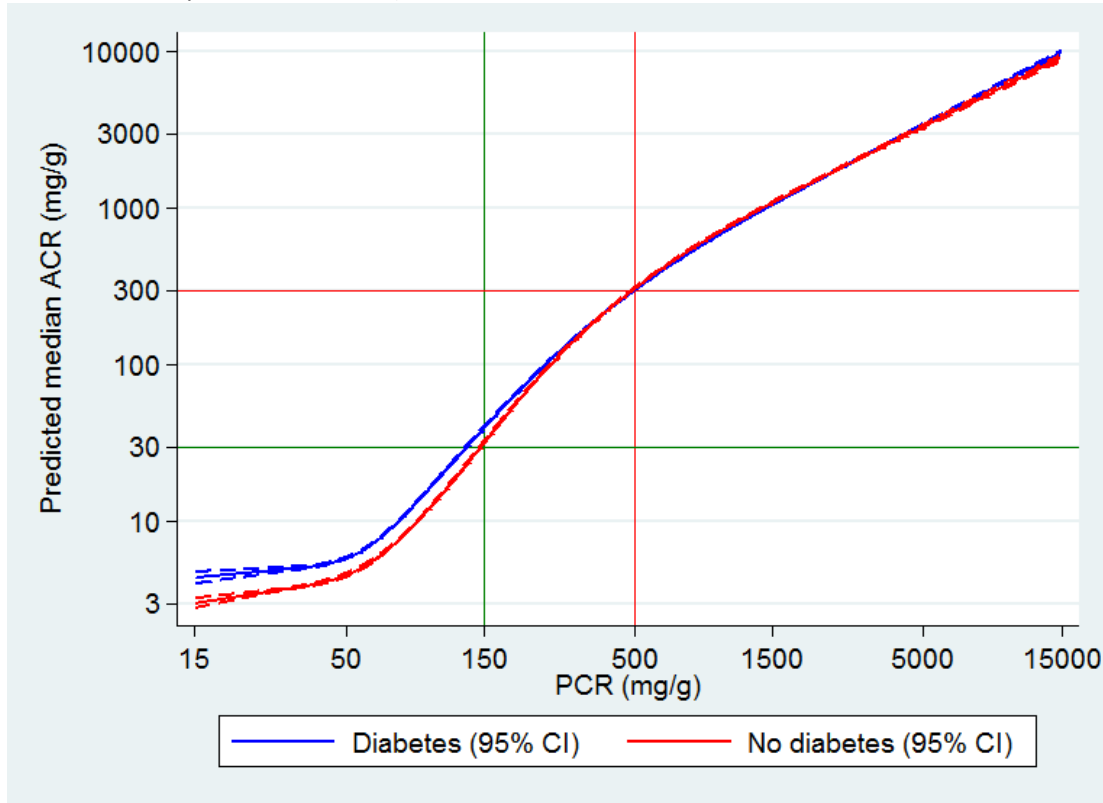

Figure S14. Effect of diabetes on median ACR, linear scale (from a model containing the cubic spline, diabetes, and spline interactions).

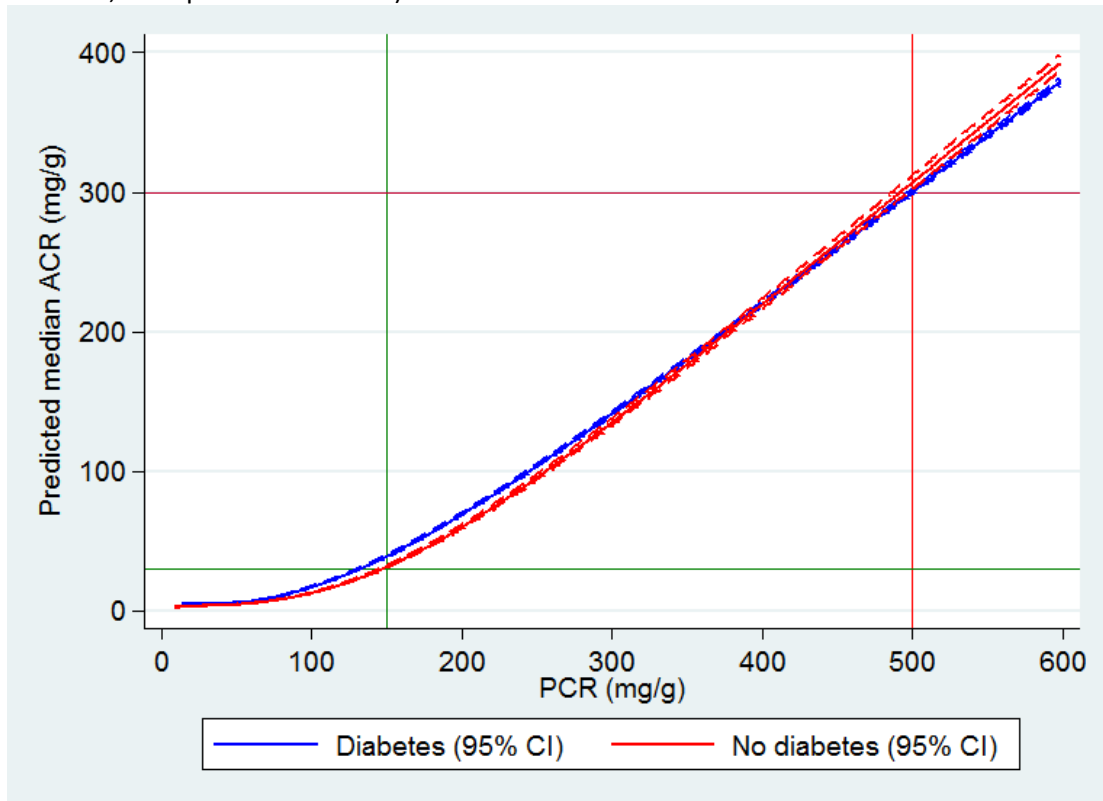

Figure S15. Effect of diabetes on percent albumin (from a model containing the cubic spline, diabetes, and spline interactions).

Figure S15. Effect of hypertension on median ACR, log scale (from a model containing the cubic spline, hypertension, and spline interactions).

Figure S17. Effect of hypertension on median ACR, linear scale (from a model containing the cubic spline, hypertension, and spline interactions).

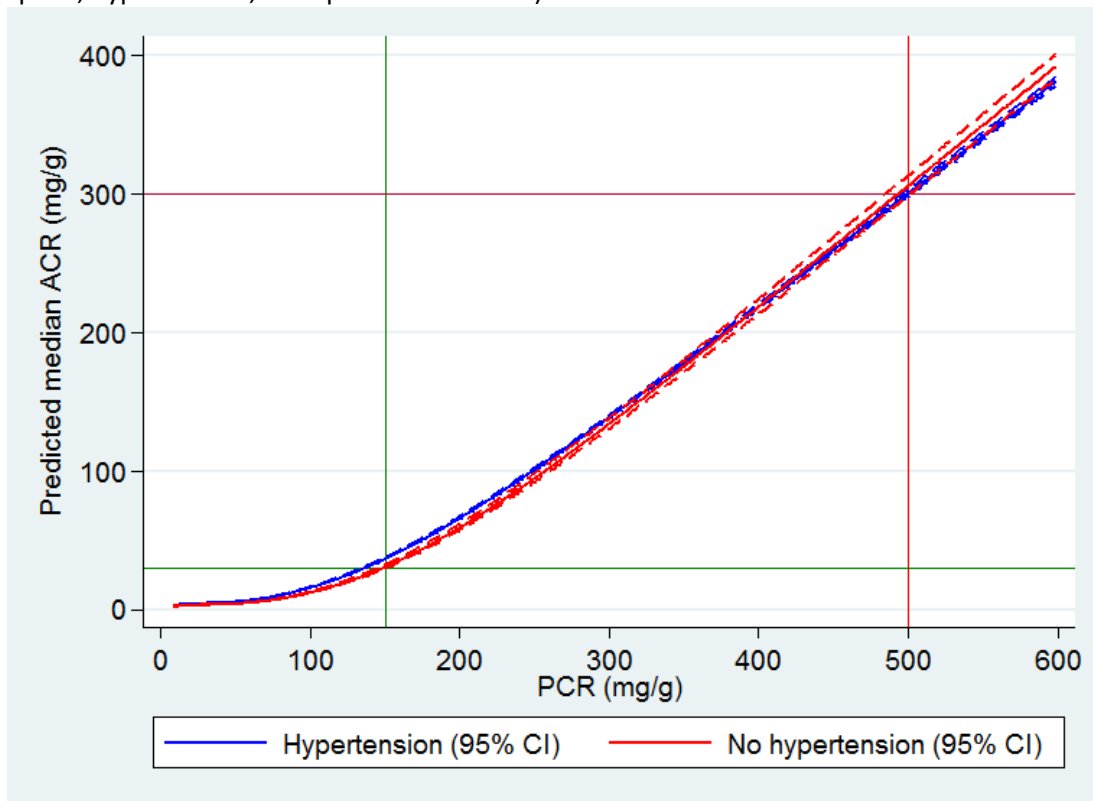

Figure S18. Effect of hypertension on percent albumin (from a model containing the cubic spline, hypertension, and spline interactions).

Figure S19. Effect of lab location (proxy for analyzer and method) on median ACR, log scale (from a model containing the cubic spline, lab location, and spline interactions).

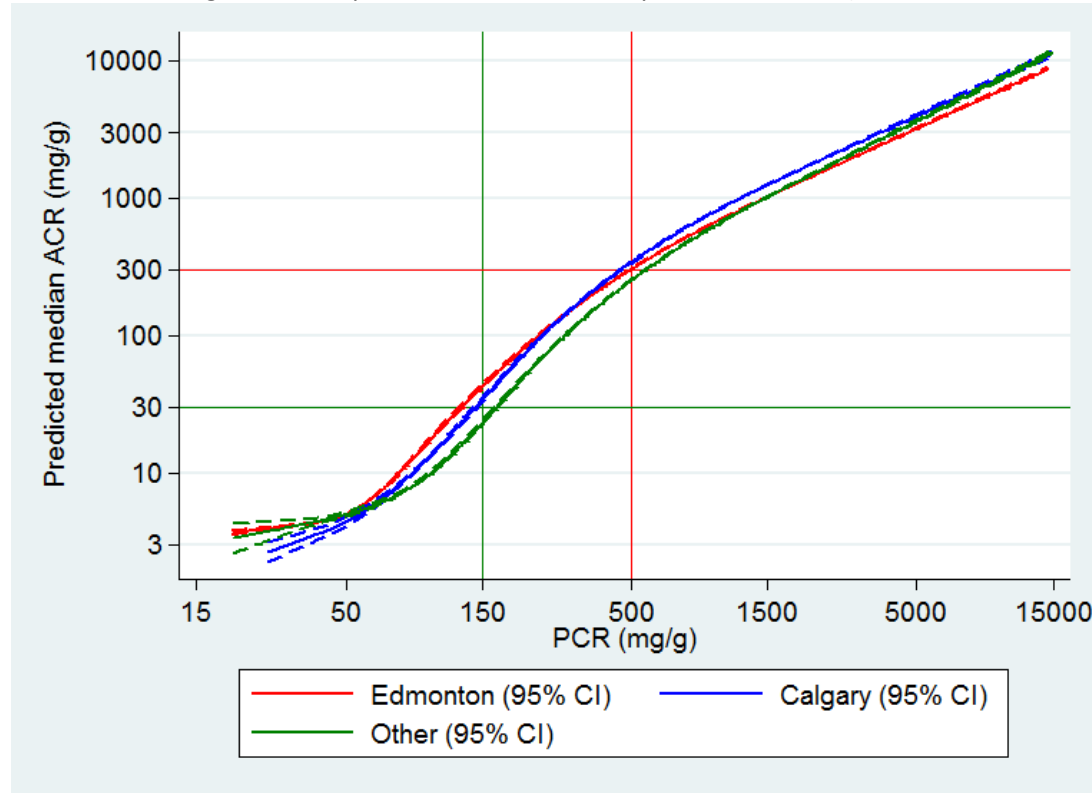

Figure S20. Effect of lab location (proxy for analyzer & method) on median ACR, linear scale (from a model containing the cubic spline, lab location, and spline interactions).

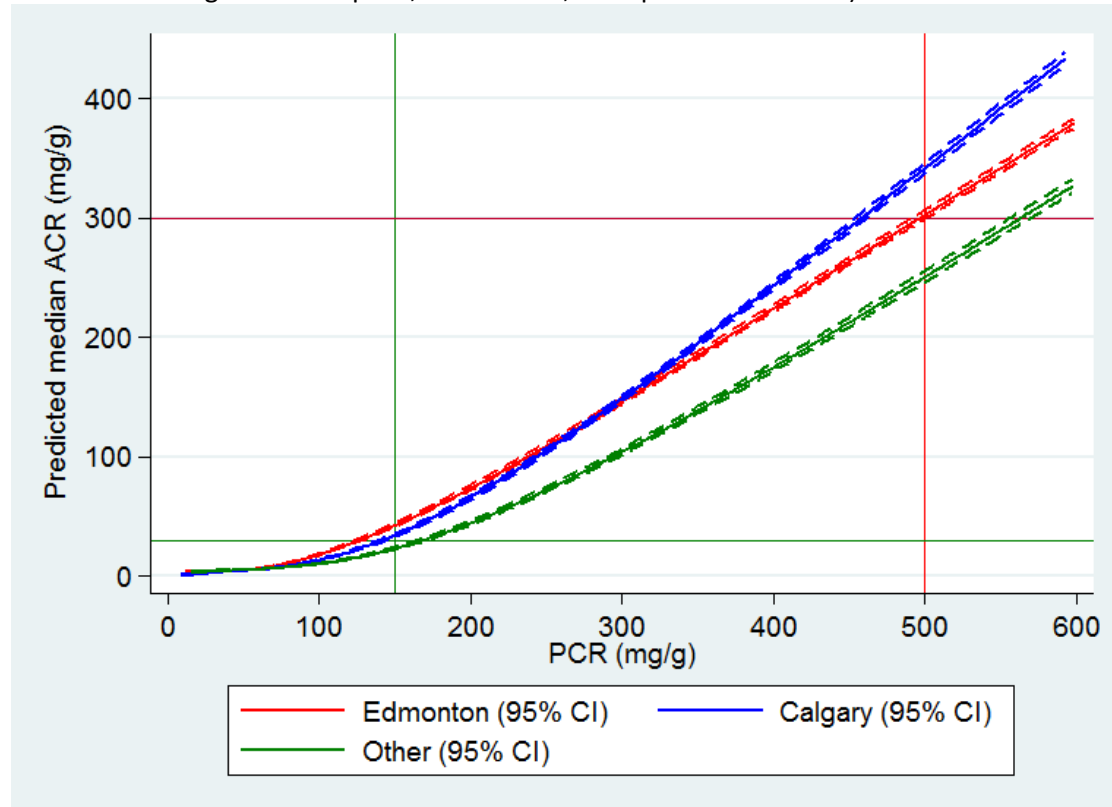

Figure S21. Effect of lab location (proxy for analyzer and method) on percent albumin (from a model containing the cubic spline, lab location, and spline interactions).

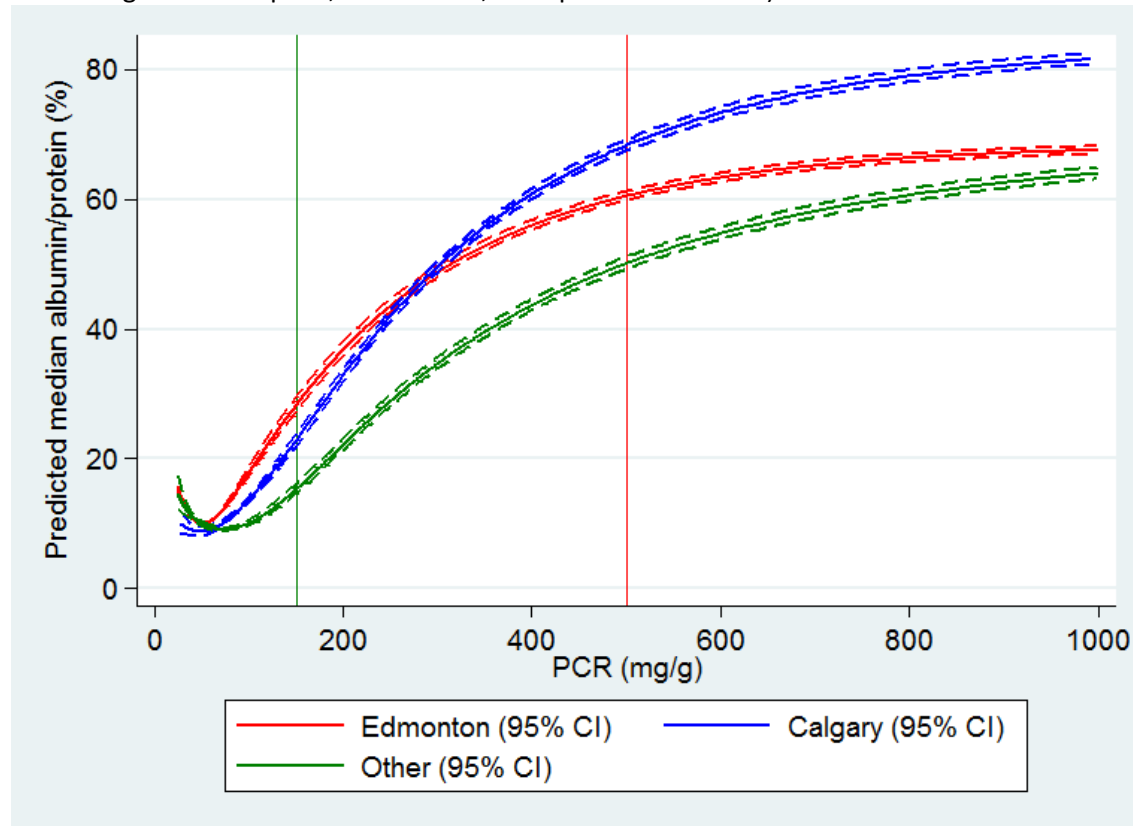

Figure S22. Comparison of predicted median ACR based on models with PCR transformed with a restricted cubic spline (C1), and with PCR transformed with a linear spline (L1). The knots for the restricted cubic spline were at percentiles 5, 27.5, 50, 72.5 and 95 of log(PCR) (3.4668, 4.0625, 4.5664, 5.3992 and 7.7333, corresponding to PCR values of 32.0, 58.1, 96.2, 221 and 2283 mg/g). Knots for the linear spline were at values of log(PCR) of 3.689, 4.094, 5.521 and 6.908, corresponding to PCR values of 40, 60, 250 and 1000 mg/g.

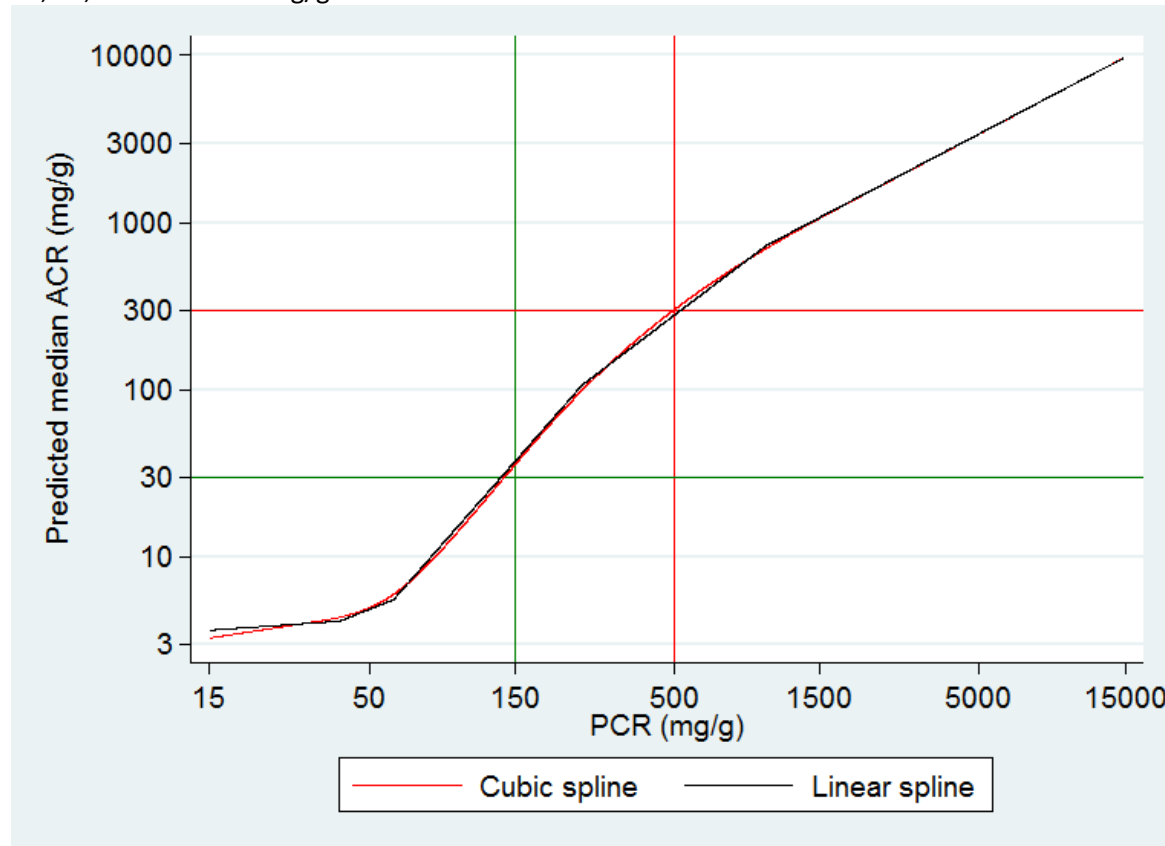

Figure S23. Scatterplot of measured ACR and median ACR predicted from the linear spline model (L2) for a 20% random sample. The blue dots represent males and the red dots females. To convert ACR or PCR from mg/g to mg/mmol, multiply by 0.113.

Figure S24. Scatterplot of measured ACR versus ACR estimated from PCR measurements for a 20% random sample, using the equations of Tangri et al.¹ The equations are: $ACR = PCR/1.7566$ if female; $ACR = PCR/2.655$ if male. Blue dots represent males, red dots females.

Figure S25. Scatterplot showing measured ACR versus ACR estimated from PCR measurements for a 20% random sample, using the equation of Collier et al.² Note that the lowest 22% of PCR values could not be shown as the predicted ACR was negative if the PCR was <52 mg/g. The equation is: $ACR = (-4 + 0.68 \cdot PCR) / 0.113$. Blue dots represent males, red dots females.

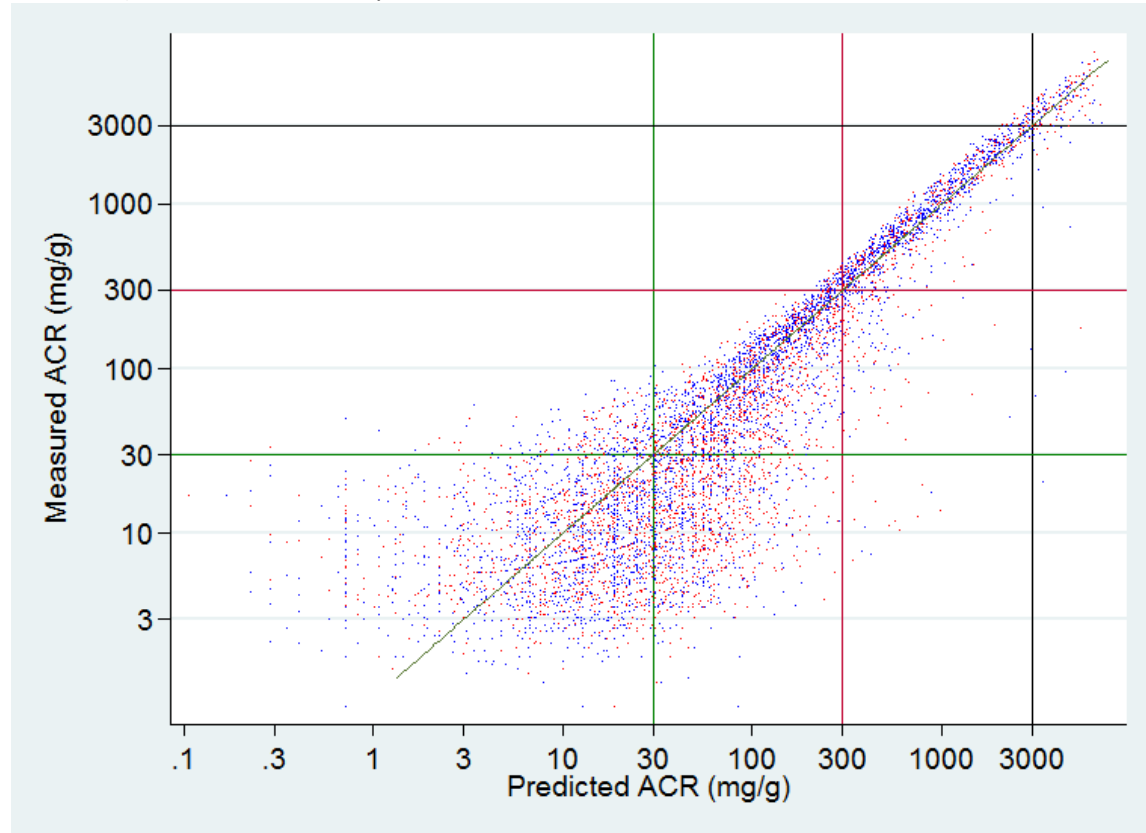

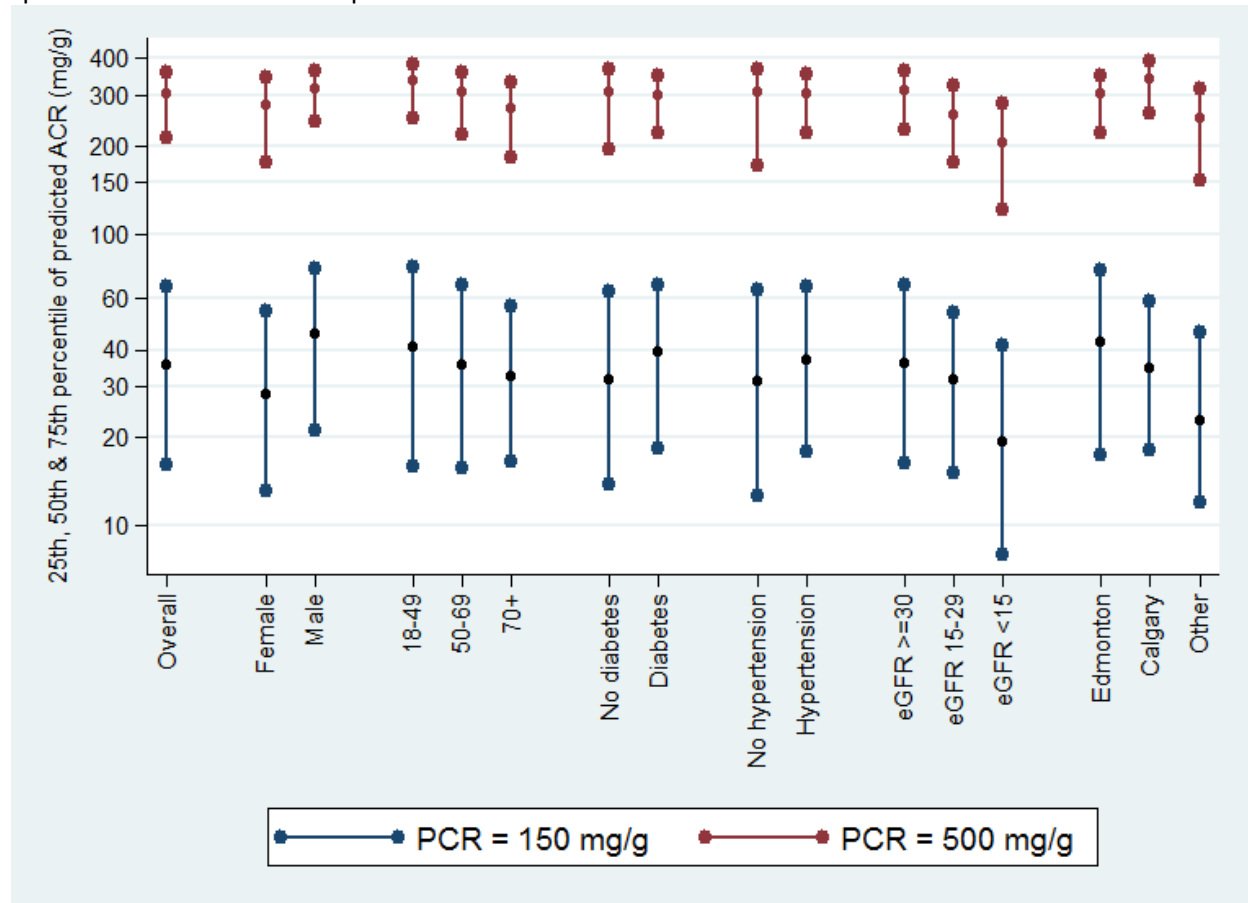

Figure S26. Estimated median, 25th and 75th percentiles of ACR at the KDIGO A1/A2 and A2/A3 PCR thresholds of 150 and 500 mg/g, overall and by specified covariate. To convert ACR or PCR from mg/g to mg/mmol, multiply by 0.113. The estimates are based on quantile regression models for the 25th, 50th and 75th percentiles of log(ACR), with log(PCR) transformed with a restricted cubic spline, and with each model containing only the specified covariate, the spline terms, and the interactions between the specified covariate and the spline terms.
