Supplemental Figure 1 Legend. (A) *In situ* hybridization by manual RNAScope for SARS-CoV-2 (C1 probe) in a patient with diagnosis of acute tubular injury (ATI) reveals rare tubules with possibly positive cytoplasmic staining. (B) Positive COVID-19 lung control demonstrates granular staining for SARS-CoV-2 (C1 probe) in the distribution of alveolar pneumocytes. (C) Negative control (a case of minimal change disease without COVID19) is essentially negative for SARS-CoV-2 (C1 probe), (all x600, with hematoxylin counterstain in A).

Supplemental Figure 1.
