

Supplemental Figure 1: Predictive power of fecal calprotectin for identifying mucosal healing at week 52 in patients (AUC=0,863, p=0,005, cut-off: 120,5 $\mu\text{g/g}$).

Supplemental Table 1: Correlation of 1-year wPCDAI, fecal calprotectin (FC) and C-reactive protein (CRP), with simple endoscopic score for Crohn's disease (SES-CD) subgroups.

SES-CD	0-2 (inactive)	3-6 (mild activity)	7-15 (moderate activity)	>15 (severe activity)
<i>Patients</i>	<i>13</i>	<i>5</i>	<i>18</i>	<i>4</i>
wPCDAI	14±8,5	21±14	28±24	43±24
<i>P value</i>		0,23	0,51	0,27
FC (mcg/g)	131±88	230±153	399±190	616±371
<i>P value</i>		0,05	0,03	0,07
CRP (mg/L)	8,5±8,2	8,8±9,6	11,5±9,4	16,3±7,4
<i>P value</i>		0,46	0,24	0,06

Supplemental Figure 2: Concordance between wPCDAI and Simple Endoscopic Score for Crohn's Disease (SES-CD) according to endoscopic disease severity.
