

Relation Between Serum Micronutrient Levels and *Helicobacter pylori* Infection in Children

Helicobacter pylori, the most common cause of gastritis worldwide, often causes deficiencies of micronutrients in the body

What is the relation between serum iron, zinc, and copper levels and the degree of gastritis in children with *H. pylori* infection and what are the effects of *H. pylori* eradication on these micronutrient levels?

***H. pylori* infection is a significant risk factor for severe gastritis and iron and zinc deficiencies in pediatric patients, but treatment can significantly improve the conditions**

Study of Serum Ferritin, Zinc, and Copper Levels in Children with *Helicobacter pylori* Gastritis and the Effect of the Treatment
