

Figure e-2. IgA concentration in individual patients.

Each panel shows the detailed IgA levels for each patient (patient 1-15) overtime.

Dotted light-blue line represents the threshold defining Hypo-IgA ($IgA < 0.7$). In particular 6 patients developed hypo-IgA during their follow-up. In two patients (#5, #10) this deficiency was present prior to the start of RTX treatment.

Orange vertical arrows represent RTX infusions.
