

Figure e-3. IgM concentration in individual patients.

Each panel shows the detailed Ig levels for each patient (patient 1-15) overtime.

Dotted lines represent the thresholds defining Hypo-IgM: the *light-blue* lines represents the Hypo-IgM threshold ($\text{IgM} < 0.4 \text{ g/l}$), as the *blue* line represents the severe hypo-IgM threshold ($\text{IgM} < 0.2 \text{ g/l}$). In particular 9 patients developed hypo-IgM during their follow-up. Patient #4 showed hypo-IgM before the first RTX infusion. Two patients (#2 #4) showed severe hypo-IgM at $\text{IgM} < 0.2 \text{ g/l}$.

Orange vertical arrows represent RTX infusions.
