eFigure 3: Characterization of the relative number of BBB-ECs from EC-HA- mice after co-culture with 8000 HA-specific CTLs

Number of BBB-ECs nuclei after a 24h co-culture of BBB-ECs from EC-HA- mice with 8000 HA-specific CTLs in the presence or absence of perforin inhibitor and/or anti-FasL mAb. The 100% value was set from the number of nuclei in the BBB-ECs from EC-HA- mice in culture without CTLs. Data represent the mean and SEM of 3 independent experiments.
