

eFigure 2. Confocal microscopy analysis validating the two anti-Spike antibodies used in the study. Post-mortem detection of Spike protein with the ab272504 and the MA5-36247 antibodies in the lung tissue from two COVID-19 negative and one COVID-19 positive patients. Wheat germ agglutinin (WGA), which binds to glycoproteins of cell membranes, was used to stain tissues. Of note, one patients had a respiratory syncytial virus (RSV) infection. Scale bar: 10 μ m.
