

Figure S7: Adjusted and unadjusted chlamydia prevalence among Hispanic (n=44,822), Black (n=155,045), White (n=95,994), and American Indian (n=7,838) men entering the NJTP, 2003-2012. Adjusted estimates and 95% CIs account for measurement error associated with changes in the diagnostic accuracy of chlamydia screening tests over time. Unadjusted estimates do not account for measurement error.
