

Figure S8: Adjusted and unadjusted chlamydia prevalence among men entering the NJTP in four regions of the US, 2003-2012 (Midwest: n=51,361; South: n=149,464; West: n=57,144; Northeast: n=45,730). Adjusted estimates account for measurement error associated with changes in the diagnostic accuracy of chlamydia screening tests over time. Unadjusted estimates do not account for measurement error.
