

## Peri-operative Guidelines for Neonates undergoing Norwood Operation

(items in **Bold** are part of the Guideline Adherence Score)

### Pre-Operative Guideline to Prepare for Norwood Operation

Component	Guidance
<b>Prior to surgery</b>	<ul style="list-style-type: none"> <li>● Identify pre-operative patient factors                             <ul style="list-style-type: none"> <li>○ Fetal intervention</li> <li>○ Gestational age &lt; 37 weeks</li> <li>○ Birth weight &lt; 2.5 kg</li> <li>○ Genetic syndrome (suspected or confirmed)</li> <li>○ Major extra cardiac abnormality or co-morbidity</li> <li>○ Concerning anatomic and physiologic findings (Intact/restrictive atrial septum, mitral hypoplasia/aortic atresia, AAO &lt; 2mm, &gt; mild atrioventricular valve regurgitation, &gt; mild ventricular dysfunction)</li> <li>○ Pre-operative intubation</li> <li>○ Other</li> <li>○ None</li> </ul> </li> <li>● Schedule the <b>pre-op discussion to occur before the day of surgery (either in the weekly surgical conference or ad hoc discussion with surgeon, anesthesiologist, CICU attending, Cardiologist, Echo attending present)</b> to:                             <ul style="list-style-type: none"> <li>○ Review anatomy and pre-operative factors/comorbidities</li> <li>○ Outline an appropriate operative plan (subject to change depending on patient condition, test results, family discussion etc.)</li> <li>○ Consider other strategies such as Hybrid procedure (or variation thereof) or non-intervention in higher risk cases – consider consulting the palliative care team</li> </ul> </li> <li>● Document pre-operative patient factors and the discussion in that day’s progress note</li> <li>● <b>Obtain a blood gas from a blood drawing venous catheter to assess acid-base status on the morning of the surgical date</b></li> </ul>
<b>Surgical Team Planning</b>	<ul style="list-style-type: none"> <li>● Assemble OR team with the overall goal to balance expertise with Norwood operation across disciplines.                             <ul style="list-style-type: none"> <li>○ <i>Anesthesia to schedule Anesthesia attending/attending surgeon team</i></li> <li>○ <i>Surgery to coordinate fellow/physician assistant team. New fellow/resident should be 2<sup>nd</sup> assist for their first Norwood case</i></li> <li>○ <i>These assignments should be made the evening before surgery</i></li> </ul> </li> </ul>

## Intra-operative Guideline for Norwood Operation (p. 1 of 2)

Component	Guidance
<b>Monitoring</b>	<ul style="list-style-type: none"> <li>• <b>Non-invasive:</b> <ul style="list-style-type: none"> <li>○ Telemetry</li> <li>○ Pulse oximetry</li> <li>○ Temperature probe (2 sites)</li> </ul> </li> <li>• <b>Invasive:</b> <ul style="list-style-type: none"> <li>○ <b>Arterial line</b> (umbilical arterial line preferred, arterial line in wrist contralateral to side of BT shunt)</li> <li>○ Umbilical venous line (either single or double lumen)</li> <li>○ Transthoracic right atrial line (2)</li> <li>○ Foley</li> <li>○ Ventricular Pacing wires</li> </ul> </li> </ul>
<b>Access</b>	<ul style="list-style-type: none"> <li>• <b>2 points of intravenous access (combination of umbilical venous catheter and/or peripheral IV)</b></li> <li>• <b>2 right atrial lines</b></li> </ul>
<b>Anesthesia (Induction, during operation)</b>	<ul style="list-style-type: none"> <li>• Intraoperative anesthetic plan to allow for extubation between 24 - 48 hours. <i><b>This plan should be reviewed with the CICU team during OR to CICU handoff.</b></i></li> <li>• Suggest ventilator strategy that addresses potential causes of hypoxemia (eg., pulmonary vein desaturation)</li> </ul>
<b>Airway</b>	<ul style="list-style-type: none"> <li>• Nasal endotracheal tube</li> <li>• Inhaled nitric oxide available</li> </ul>
<b>Procedure</b>	<ul style="list-style-type: none"> <li>• Per pre-operative discussion</li> <li>• Modified ultrafiltration (if hemodynamics tolerate)</li> </ul>

**Intra-operative Guideline for Norwood operation (continued p. 2 of 2)**

Component	Guidance
<p align="center"><b>Cardiopulmonary Bypass (CPB)</b></p>	<ul style="list-style-type: none"> <li>● <b>Prime CPB pump exclusively with fresh whole blood which would result in a Hct &gt; 30%</b></li> <li>● <b>Use FFP and PRBC's to prime the pump when whole blood not available</b></li> <li>● Goal Hct ranges:               <ul style="list-style-type: none"> <li>○ 30% while on CPB (range of 28-32)</li> <li>○ 40-45% after MUF</li> </ul> </li> <li>● Cool for 15 minutes, warm for 22 minutes</li> <li>● Rewarm to venous temperature of &gt; 36°C or combined NP/ESO temperatures &gt; 72</li> <li>● <b>Milrinone 100 micrograms/kg bolus in pump at the start of the 22 minute rewarming period</b></li> </ul>
<p align="center"><b>Medications</b></p>	<ul style="list-style-type: none"> <li>● Milrinone – additional bolus doses as needed after coming off bypass</li> <li>● Dopamine – Low dose (1-3 mcg/kg/min) if needed</li> <li>● Ketamine – 0.15 mg/kg/hr</li> <li>● Dexmedetomidine - 0.2 mcg/kg/hr</li> <li>● Milrinone 0.2 mcg/kg/min</li> <li>● If patient needs &gt; 3mcg/kg/min of Dopamine or any epinephrine, then consider further investigation depending on particular concern (TEE, cath., re-exploration, leaving chest open, ECMO, etc.)</li> <li>● <b>Anesthesia team to order Dexmedetomidine, Ketamine and IV Tylenol to be given when patient arrives in the CICU.</b></li> <li>● <b>Anesthesia team to order Milrinone, epinephrine, dopamine, and inhaled nitric oxide to be available when patient arrives in the CICU.</b></li> </ul>
<p align="center"><b>Hemostasis</b></p>	<ul style="list-style-type: none"> <li>● Amicar should be given to all patients</li> <li>● <b>The following blood products should be ordered and available when coming off bypass:</b> <ul style="list-style-type: none"> <li>○ <b>PRBC</b></li> <li>○ <b>Platelets</b></li> <li>○ <b>Cryoprecipitate</b></li> <li>○ <b>Novo 7</b></li> </ul> </li> <li>● Coagulation labs – patient-specific depending on concern for bleeding.</li> <li>● Leave chest open if concern for bleeding with normal coagulation studies</li> </ul>

OR to CICU Transition	
Component	Guidance
OR Team Debrief	<ul style="list-style-type: none"> <li>• Post procedure debriefing among the OR team to highlight important intra-operative issues</li> </ul>
OR to CICU Hand-off	<ul style="list-style-type: none"> <li>• Attending surgeon, anesthesiologist, CICU attending, frontline clinician, CICU nurse <i>and the CICU attending on the other team</i> should be present at bedside to discuss the following: <ul style="list-style-type: none"> <li>○ The relevant details of OR course</li> <li>○ <b>Highlight the main concern(s) for the overnight CICU team</b></li> <li>○ <b>Discuss candidacy for extubation over the next 24-48 hours</b> and state the strategies and goals (see post-op <i>Sedation</i> section in this guideline)</li> <li>○ <b>When possible, the overnight CICU attending should also be present for the hand-off</b></li> </ul> </li> </ul>
CICU Team Planning	<ul style="list-style-type: none"> <li>• Assign CICU team for the patient <b>with the overall goal to balance expertise with immediate (POD 0-2) post-Norwood care across disciplines.</b> <ul style="list-style-type: none"> <li>○ <i>Nurse practitioners to assign front line clinician with experience caring for Norwood patients (either an NP or experienced senior cardiology fellow or 4<sup>th</sup> year CICU fellow)</i></li> <li>○ <i>Nursing to assign an experienced nurse at the bedside.</i></li> <li>○ <b>Ensure senior provider (frontline and bedside nurse) is available for support when junior providers are assigned.</b></li> </ul> </li> </ul>

## Guideline for Post-Operative Days 0-2 after Norwood Operation (p. 1 of 3)

Monitoring	Guide	Worrisome Sign/Trend	Considerations
<b>Arterial Blood Gas (ABG) monitoring (for metabolic acidosis)</b>	<p><b>For first 12 hours post-op, obtain ABG:</b>  <b>On arrival</b>  <b>Q 30 min x1 then</b>  <b>Q 1 hour x2 then</b>  <b>Q 2 hours</b>  <b>Every other gas with lactate</b></p> <p>Then, ABGs as needed</p>	<p>Base deficit:</p> <ul style="list-style-type: none"> <li>Fall by 2 on consecutive gases or</li> <li>Fall by 4 on one gas</li> </ul> <p>Need for NaHCO<sub>3</sub> x2                      Rising lactate</p>	<ul style="list-style-type: none"> <li>CXR</li> <li>Consider TTE to evaluate function, effusion, AVVR, aortic arch repair</li> <li>Call to surgeon*</li> </ul>
<b>Oxygenation</b>	<p>Goal PaO<sub>2</sub> 35-45                      Goal SaO<sub>2</sub> 70-85%                      (Of note, abnormalities in SpO<sub>2</sub> can prompt initial investigation/therapy but should be confirmed with ABG)</p>	<p>PaO<sub>2</sub> &lt;34, SaO<sub>2</sub> &lt;70%                      “severe” if:</p> <ul style="list-style-type: none"> <li>PAO<sub>2</sub> ≤ 28, SaO<sub>2</sub> ≤ 65%</li> <li>PH is low</li> <li>Not responding to maneuvers</li> </ul>	<ul style="list-style-type: none"> <li><b>Always:</b> check CXR &amp; Hgb, transiently increase FiO<sub>2</sub>, evaluate ventilator with respiratory therapist</li> <li><b>Consider</b> vasoactive medications, increased MAP goal, shunt imaging (echo vs cath)</li> <li>If “severe”, call to surgeon*</li> </ul>
		<p>PaO<sub>2</sub> &gt;45, SaO<sub>2</sub> &gt; 85%</p>	<ul style="list-style-type: none"> <li><b>Always:</b> wean FiO<sub>2</sub></li> <li><b>Consider</b> weaning vasoactive infusions vs. adding milrinone &amp;/or TTE (arch imaging)</li> </ul>
<b>Blood Pressure</b>	<p><b>Record right arm BP and simultaneous umbilical artery line BP within 2 hours after arrival to CICU</b>                      MAP goal 40-50                      Lower MAP goal can be appropriate depending on gestational age                       Higher MAP goal can be appropriate depending on oxygenation/end-organ needs</p>	<p>MAP &gt; 50</p>	<ul style="list-style-type: none"> <li>If arm hypertension, check leg blood pressure and consider TTE to assess aortic arch repair</li> <li><b>Consider</b> starting or increasing milrinone; weaning the non-milrinone vasoactive medications</li> </ul>
		<p>MAP &lt; lower limit                      May be permissible if O<sub>2</sub> delivery is adequate                      Frequent calcium boluses</p>	<ul style="list-style-type: none"> <li><b>Always:</b> evaluate perfusion, urine output, chest tube output, rhythm, calcium level and acidosis</li> <li><b>Consider:</b> vasoactive infusions (see below), lowering milrinone dose, TTE to check function, effusion</li> </ul>

**Guideline for Post-Operative Days 0-2 after Norwood Operation (continued, p. 2 of 3)**

Monitoring	Guide	Worrisome Sign/Trend	Considerations
<b>RA (CVP) pressure</b>	Goal RAp 4-9 If abnormality, check: Waveform (re-zero line) Infusing status Blood return	RAp < 4	<ul style="list-style-type: none"> <li>• Consider volume infusion (especially if tachycardia or hypotension)</li> <li>• Consider TTE (agitated saline injection to confirm RA line position)</li> </ul>
		RAp > 9	<ul style="list-style-type: none"> <li>• Always: check chest tube(s) patency, CXR</li> <li>• TTE (function, effusion, avvr, arch repair, agitated saline)</li> <li>• If hemodynamically significant, call to surgeon*</li> </ul>
<b>Chest tube output</b>	Goal < 3 cc/kg/hr (Of note laboratory assessment of significant bleeding includes: CBC, PT, PTT INR and fibrinogen)	>3 cc/kg/hr Severe if >10cc/kg/hr or not responding to blood products	<ul style="list-style-type: none"> <li>• CXR</li> <li>• If MAP &gt; 50, see "Blood Pressure" above</li> <li>• Consider coagulopathy and thrombocytopenia</li> <li>• Consider ordering vs. giving empiric blood products</li> <li>• If severe, call to surgeon &amp; anesthesia*</li> <li>• Consider Novo7, protamine (with surgeon input)</li> </ul>
		Sudden drop in output	<ul style="list-style-type: none"> <li>• Check chest tube patency</li> <li>• If hemodynamic significant: CXR, consider TTE and call to surgeon*</li> </ul>
<b>Arrhythmia management</b>	<b>ECG within the first 12 hours post-op</b>	Arrhythmia	<ul style="list-style-type: none"> <li>• Always: repeat ECG</li> <li>• Consider Electrophysiology consultation, weaning vasoactive infusions if adrenergic driven</li> <li>• Discussion with CICU attending prior to starting antiarrhythmic</li> </ul>

**Guideline for Post-Operative Days 0-2 after Norwood Operation (continued, p. 3 of 3)**

Monitoring	Guide	Worrisome Sign/Trend	Considerations
<b>Vasoactive infusions</b>	General starting doses: Dopamine 3 mcg/kg/min Epinephrine 0.02 mcg/kg/min	VIS = Dopa + Epi x 100 VIS increasing by 2 VIS >5 Dopamine > 5 Epinephrine > 0.05	<ul style="list-style-type: none"> <li>Always: CXR, make sure line is working</li> <li>Call to surgeon*</li> <li>TTE (function, fluid, AVVR, arch repair, agitated saline injection to assess line position)</li> </ul>
<b>Renal function/ Diuretics</b>	<b>Start Lasix when UOP is &lt; 1c/kg/hr</b> Starting dose of furosemide: Intermittent: 1mg/kg/dose Q 6 hr Infusion: 0.1 mg/kg/hr	No response to diuretic Rising Creatinine Clinical fluid overload	<ul style="list-style-type: none"> <li>Always: troubleshoot Foley catheter</li> <li>Check BMP</li> <li>If no UOP despite escalating diuretics, consider renal U/S +/- nephrology consultation</li> </ul>
<b>Ventilator management</b>	Goal TV 10-12 cc/kg/hr Initial Peep 3-5 RR 20-30	Refractory respiratory acidosis Need RR>30 PIP >30 or sudden increase	<ul style="list-style-type: none"> <li>Always: suction ETT, CXR</li> <li>Troubleshoot ventilator with respiratory therapist</li> </ul>
<b>Analgesia &amp; Sedation</b>	<b>All patients should receive Tylenol IV (unless clinical contraindications)</b> <b>Refer to Extubation Readiness Guideline.</b> <i>If extubation is planned 24-48 hours</i> after arrival, preferred strategy: Analgesia: Ketamine infusion (0.15 mg/kg/hr) Sedation: Dexmedetomidine (0.2 mcg/kg/hr)  <i>If extubation is planned after 48 hours</i> , follow <a href="#">CICU sedation pathway</a> . Consider neuromuscular blockade for unstable patients	More than 3 fentanyl doses administered in 4 hours  Escalating ketamine or fentanyl infusion	<ul style="list-style-type: none"> <li>Increase Dexmedetomidine or ketamine infusions</li> <li>Consider increasing Milrinone or giving Fentanyl prn if hypertension with intent to preserve extubation readiness by 1<sup>st</sup> post-operative morning</li> <li>To avoid peri-extubation narcotics, consider leaving infusions on through extubation or turning off at the time of extubation.</li> </ul>

**\*If discussion with surgeon includes consideration of intervention (eg. re-exploration, cath, ECMO):** 1) Call anesthesia; 2) Call blood bank and order blood products for intervention/ECMO; 3) Order procedure request (surgical or cath) OR start ECMO order set according to patient weight.

**Review the following CHOP Pathways for additional guidance:**

[Nutrition Pathway for Neonates after Surgery for Congenital Heart Disease](#)

[Inpatient Pathway for the Evaluation/Treatment of Fetus or Newborn with Single Ventricle](#)

**QI team will schedule a post-operative inter-disciplinary debrief session.** Please contact QI team leads with any questions or suggestions (contact information included)

## Abbreviations

AVVR	atrioventricular valve regurgitation
Cath	cardiac catheterization
CICU	cardiac intensive care unit
CPB	cardiopulmonary bypass
CBC	complete blood count
CVP	central venous pressure
CXR	chest x-ray
ECG	electrocardiogram
ECMO	extracorporeal membrane oxygenation
ETT	endotracheal tube
FFP	fresh frozen plasma
Hgb	hemoglobin
Hct	hematocrit
iNO	inhaled Nitric Oxide
MPA	mean arterial pressure
MUF	modified ultrafiltration
Novo 7	Coagulation Factor VIIa (Recombinant)
NP	nurse practitioner
OR	operating room
PRBC	packed red blood cells
PT/INR	prothrombin time/ international normalized ratio
PTT	partial thromboplastin time
RAp	right atrial pressure
TEE	transesophageal echocardiogram
TTE	transthoracic echocardiogram
UOP	urine output
VIS	vasoactive infusion score
