

Supplemental Digital Content 5 (Figure). Longitudinal patterns of individual Fried's frailty phenotype criteria by frailty status. “Lasagna” plots illustrating values at frailty assessments relative to endpoint for the indicated frailty phenotype criteria for each participant (rows). Participants were ordered vertically by frailty status at endpoint, then by number of positive criteria at endpoint and assessment immediately prior. Endpoint was defined as first assessment classified as transitioning to frailty or last assessment classified as remaining non-frail (robust or pre-frail).
