Figure S1. CRP-levels after trauma (A) and CRP-levels relative to the onset of organ dysfunction (B). Day 0 is the first day that acute respiratory distress syndrome or multiple organ dysfunction syndrome occurred according to the Berlin definition and Denver criteria respectively. Data are presented as mean with standard error of the mean (SEM). Polytrauma patients who developed organ dysfunction had significantly higher CRP-levels (ß 7.12, p = 0.012, day 1-10) than polytrauma patients who did not develop organ dysfunction. CRP-levels slightly increased before organ dysfunction and further increased thereafter, to levels only observed in patients with organ dysfunction.
