

Supplemental 1: Pig-specific Human IgG Cross-reacts with Class I Human Leukocyte Antigens: Example 2

A) Shows FCXM to porcine PBMC and a single donor human PBMC. B) The intact human serum was incubated with the HLA beads. C) Antibodies were eluted from the human cells shown in figure B and tested for reactivity to porcine PBMC and recovered reactivity to human cells. D) The human eluted sample reactivity to HLA beads. E) Porcine eluted antibodies were tested for recovery of reactivity and reactivity to human cells. F) Porcine eluted antibodies react to HLA beads in a further restricted pattern of cross reactive binding. HLA single antigen beads are displayed in the same order from left to right in figures B, D and F.
