Favorable outcomes of liver transplantation from controlled circulatory death donors using normothermic regional perfusion compared to brain death donors

Savier et al. *Transplantation*. 2020

**Results**

Early allograft dysfunction:
- cDCD + NRP: 18% vs. DBD: 32%, (p=0.11)
- Arterial (4% vs. 12%; p = 0.19) and biliary (16% vs. 17%; p = 0.94) complications

**Conclusion**

cDCD + NRP liver transplantation can be safely performed in selected recipients with similar graft and patient survival outcomes, without increased rates of biliary complications and early graft dysfunction compared to DBD LT.
