

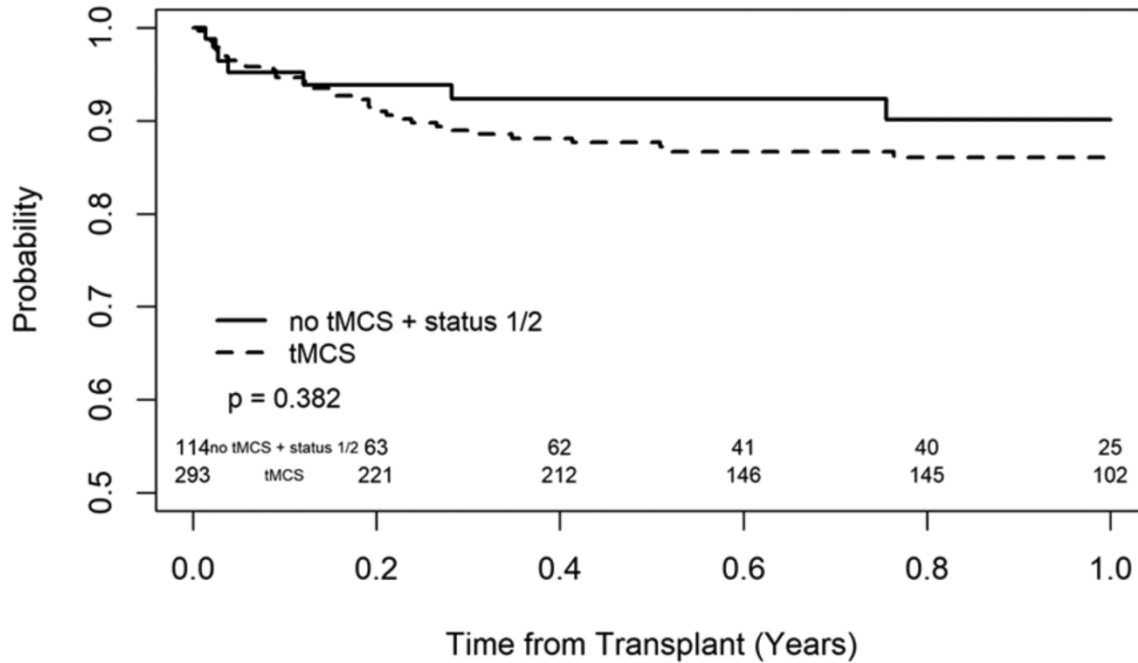

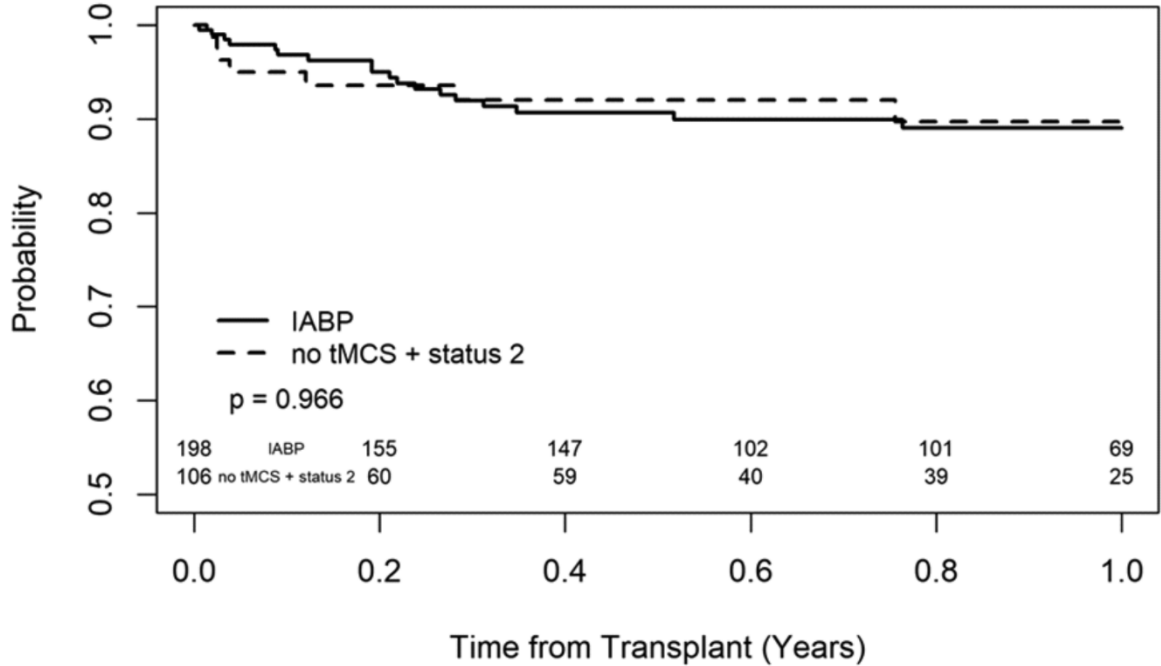

Figure S1. Survival of simultaneous heart-kidney transplant recipients bridged with intraaortic balloon pump, veno-arterial extracorporeal membrane oxygenation, or Impella compared with candidates transplanted from urgency status 1 or 2 but without tMCS support (no tMCS + status 1/2 group). There was no significant difference in 1-year survival. Data analysis was restricted to the current heart allocation policy era.

tMCS, temporary mechanical circulatory support.

Figure S2. Survival of simultaneous heart-kidney transplantation recipients bridged with an IABP (IABP group) and those listed as urgency status 2 but without a tMCS device. There was no significant difference in 1-year survival. Data analysis was restricted to the current heart allocation policy era.

IABP, intraaortic balloon pump; tMCS, temporary mechanical circulatory support.
