

Biomarkers of cytokine release syndrome predict disease severity and mortality from COVID-19 in kidney transplant recipients

Background

- Unclear association between cytokine release syndrome and severe outcomes in immunocompromised kidney transplant recipients with COVID-19

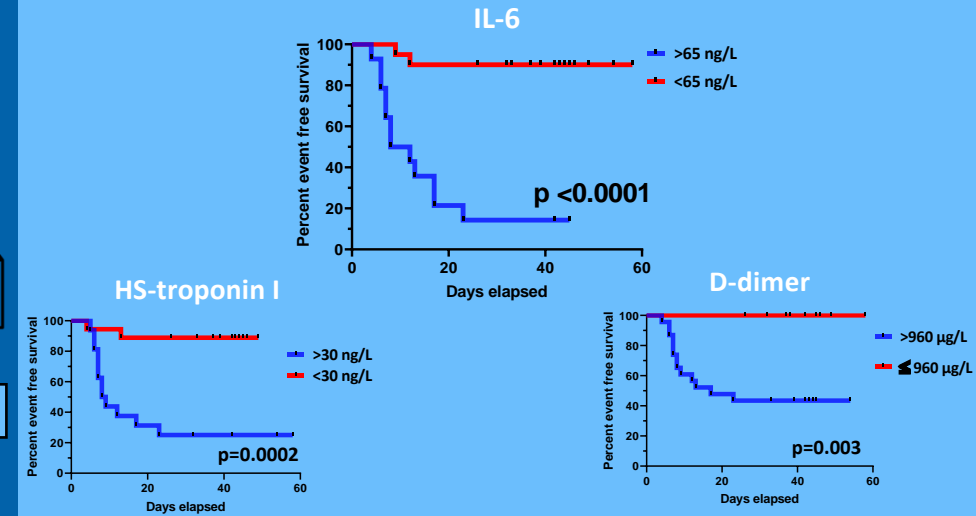

Patients and Methods

- Analyse of clinical and biological factors associated with severe disease and mortality

Results

Severe COVID-19-free survival according to IL-6, Hs-troponin and D-dimer levels

Conclusion

Biomarkers of inflammation, cardiac injury, and coagulopathy are associated with COVID-19 severity and mortality in kidney transplant recipients
