**eFigure 2** Kaplan-Meier curves showing outcomes for lower extremity involvement (A) and independent ambulation loss (B) in FSHD1 patients stratified into three groups depending on contracted D4Z4 RUs: group 1 with 1–3 RUs, group 2 with 4–6 RUs, and group 3 with 7–9 RUs. (A) Significant differences in outcomes of lower extremity involvement among the three groups were analyzed by log-rank (Mantel-Cox) tests ($p < 0.0001$). (B) No significant differences in outcomes of independent ambulation loss among the three groups ($p = 0.054$) were analyzed by log-rank (Mantel-Cox) tests.
